

Match a Python concept/library with its purpose.

A philosophy for how to write and think like a Python programmer. ✓

Zen of Python (import this)

Flags used to format numbers into easily readable objects. ✓

String formatting (.4f,.2%, ,)

Test membership. Usually used with strings or lists. ✓

In and not in statements

Returns a list of the dictionary's values.

Dictionary values

Great for using to test membership. ✓

Enable quick and easy list assembly using an iterator, a function, and/or an if statement to further clean and process your data. ✓

List generators

Lets you store your data in a CSV using the csv writer class. ✓

CSV writer object

Enables you to easily format Python date objects into strings and create objects out for strings. ✓

Datetime.strptime and strftime methods

A basic outline of some best practices to follow as a new Python developer. ✓

Python best practices

Question 1

Correct

Mark 1.00 out of 1.00

🚩 Flag question

Question 2

Correct

Mark 1.00 out of 1.00

 Flag question

Match the Python practice with a description.

Use proper exceptions in your try blocks, be specific in your documentation, and use specific variable names. 

Be specific 

All code should be under version control, so you or your colleagues can create new branches ,try out new features, and still have a working master version of the repository. 

Version control 

All functions, variables and files should have clear names that make their contents of intended use obvious. 

Clear naming 

Organise your repository into a logical and hierarchical structure, so code used together is organised together and follows normal logical patterns. 

Repository organization. 

When applicable and possible, test your code by using test example data and writing tests for your individual functions.

Test your code

Create abstract helper functions to make your code clear and reusable (e.g. `export_to_csv` to take a list and write a CSV export).

Helper functions.

Variables and functions should follow proper Python syntax (generally lowercase with underscores between words, or CamelCase for class names) and the code should follow PEP=8 standards.

Proper syntax

Include comments, function descriptions, and script clarifications throughout the code, as well as *README.md* files or any other necessary description in the repository structure.

Documentation

When you need to do something someone else has already coded in Python, don't reinvent the wheel. Use good libraries and contribute to them to help the open source community.

Use libraries

Use the syntactic sugar of Python to write fast and efficient code, but err on the side of clarity if the two are opposed.

Fast but clear

Only import what you need and use, and follow PEP-8 guidelines for you import structure.

Imports
